

CANNON DESIGN FLETCHER ALLEN CANCER CENTER

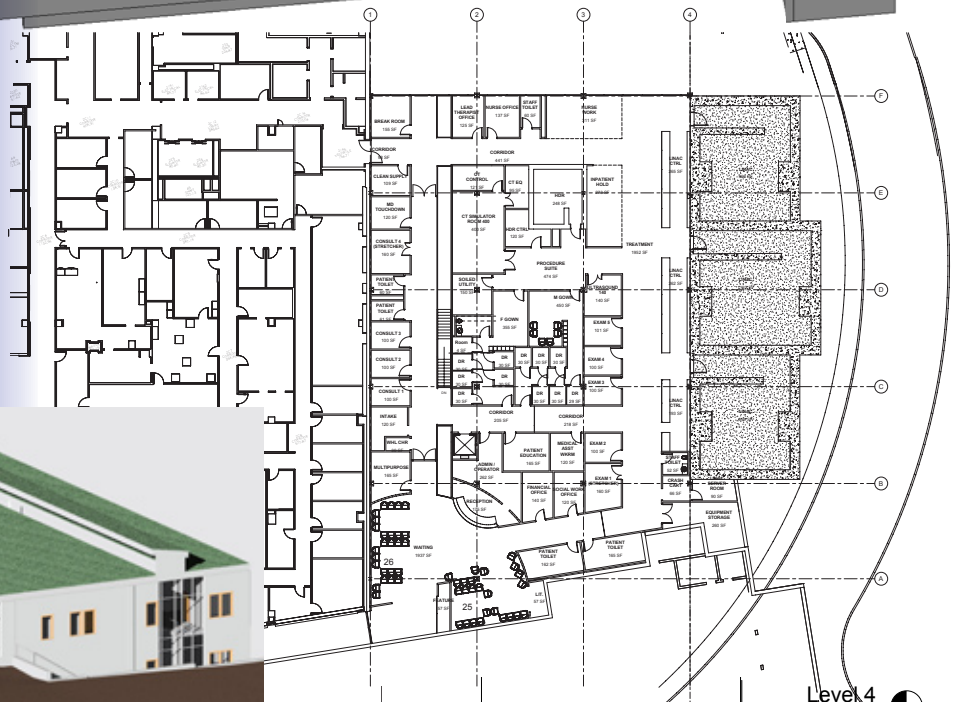

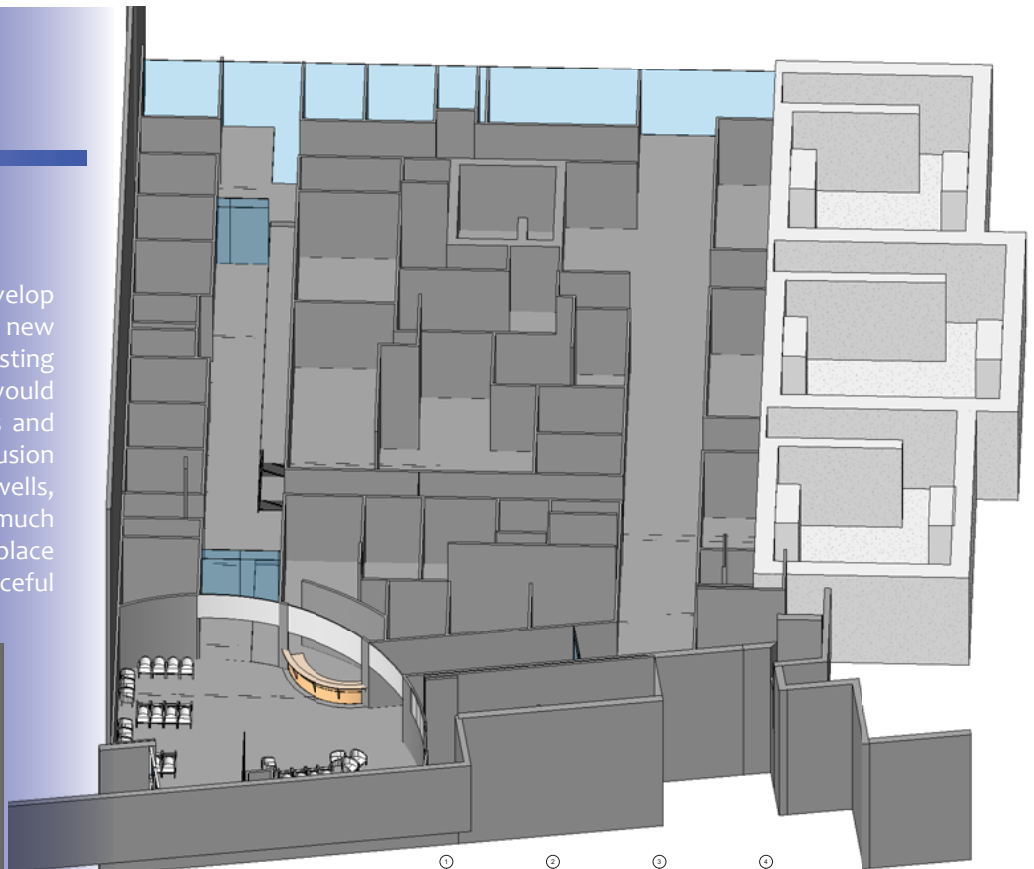

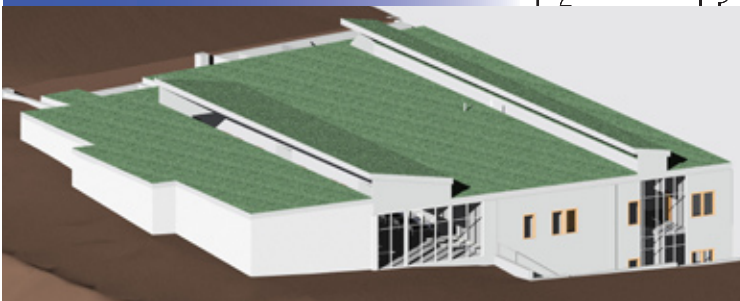

PLANNING

2007-2008

My role in this project was to develop and present design options for a new radiation-oncology center on existing hospital grounds. The building would be adjacent to existing structures and mostly under ground. With the inclusion of extensive skylights and light wells, the design intent was to bring as much light into the space to make it a place that would be comfortable and peaceful to be in.

During the development of design options, I generated 3-dimensional imagery of key spaces to convey my ideas. These images feature the main corridors with extensive skylights.
